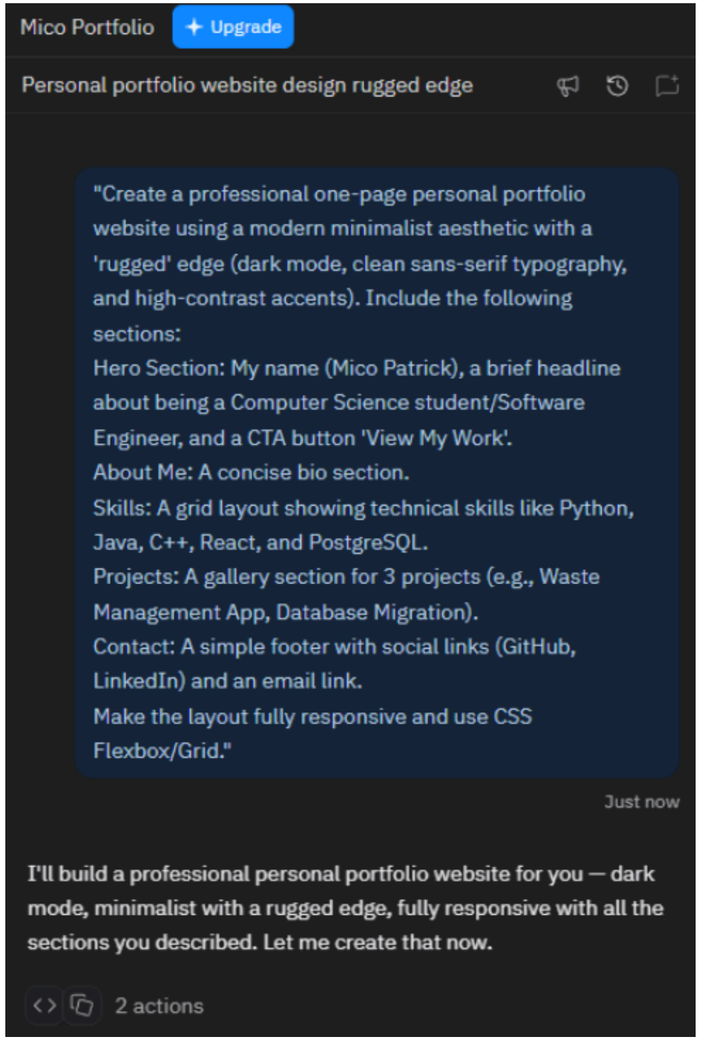
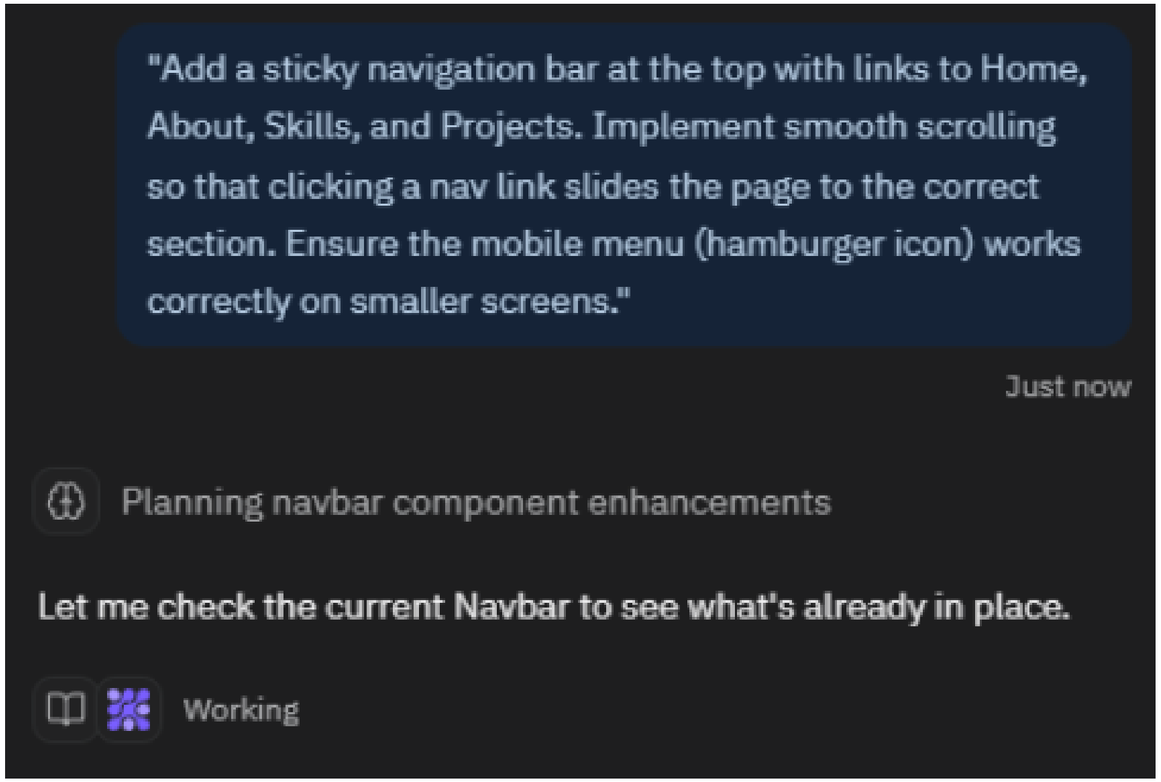
One-page website using Replit.

Mico Patrick M. Pulido
2nd Year Computer Science Student
IT SKILLS BSCS-2A

Initial Prompt:



Refinement Prompt:



Refinement Prompt:

"Enhance the visual design by adding subtle hover effects to the project cards (like a slight lift or border color change). Update the typography to use a professional Google Font like 'Inter' or 'Roboto'. Add consistent padding and spacing between sections to improve readability, and ensure all buttons have a distinct, modern style."

Just now

Analyzing project card requirements

Let me read the relevant files in parallel to plan the updates.

Final Reflection:

What worked well?
Rapid Prototyping: The AI was incredibly fast at generating the foundational HTML structure and CSS boilerplate (like Flexbox layouts and grid systems) that would usually take much longer to write from scratch.

What needed manual fixing?
Asset Management: The AI often uses "placeholder" images or broken links for icons and photos. I had to manually upload my own images to the Replit file tree and update the <img> tags with the correct file paths.

What did you learn about prompting?
Specificity is Key: I learned that vague prompts lead to generic designs. By including specific keywords like "rugged yet modern," "dark mode," and "sans-serif typography," I was able to get a result that matched my personal branding.
